The Decision Velocity Audit

Paper II's doctrine in one line: in most domains, decision velocity beats decision quality — the fast mover adjusts by dinner while the staller is still listing pros and cons. This sheet runs the doctrine on ONE decision you're currently sitting on.

1 · The stalled decision

Name the decision you've been circling. How long has it been open?

The decision: _____

Open since: _____ **People whose opinion I've already asked:** _____

2 · The expected-value pass (poker player math, 2 minutes)

If it goes well: what do I gain? _____ × how likely? _____ %

If it goes badly: what do I lose? _____ × how likely? _____ %

Reversibility — the two-way-door test: if it goes badly, can I adjust within a week? ☐ Yes ☐ No

If YES, the math says: any positive read = GO. Speed is worth more than certainty behind a two-way door.

3 · The body pass (it knew 70 trials before you did)

Sit with each option for ten seconds. No analysis — just notice.

Option A feels like: ☐ expansion ☐ contraction **Option B** feels like: ☐ expansion ☐ contraction

My body has been leaning: _____ **for how long:** _____

4 · Name your paralysis level

Which one is actually holding this decision open?

☐ **1 · Information addiction** — “I just need one more data point” ☐ **2 · Option preservation** — keeping every door open, walking through none ☐ **3 · Consensus seeking** — polling until someone decides for me ☐ **4 · Perfect-timing myth** — waiting for a window

that doesn't exist □ **5 · Identity lock** — this decision says something about who I am, so I can't touch it

Mine is level _____ **because** _____

5 · Collapse the superposition

Indecision is remaining in superposition — where nothing is real and nothing compounds.

My decision is: _____

Decided by (date, within 72 hours): _____ **First adjust-point (by dinner which day):** _____
